SCENARIO	Entice	Enter	Engage	Exit	Extend
Reporting, auto-classifying, routing and resolving a school IT support ticket	Entice How does someone initially become aware of this process?	Enter What do people experience as they begin the process?	Engage In the core moments in the process, what happens?	Exit What do people typically experience as the process finishes?	Extend What happens after the experience is over?
Steps What does the person (or group) typically experience?	Experience an IT issue A student or teacher hits a Wi-Fi, projector, password or slow-computer problem Decide to ask for help They look to the school IT helpdesk to get it fixed Open the helpdesk They sign in to the school's ServiceNow instance Start a new ticket They open a new record in the Incident Workflow table	Select the caller The Caller field links to a user record Write a short description e.g. 'Wi-Fi not working in Lab 2' - the key input Add details They can optionally fill in the longer Description Submit the ticket Record is created with Category empty and State New	Flow is triggered 'Auto Classify School IT Tickets' fires on Record Created when Category is empty Scan for keywords If / Else If checks the Short description for each issue type Update the record Category and Subcategory are filled in automatically Send the email The Send Email action runs after classification	Receive confirmation The caller gets an email saying the request was submitted Ticket is standardized Number, Category, Subcategory and State are all populated Ticket is routed The Assigned Group can see a classified ticket Agent picks it up An agent is set as Assigned to and moves State to In progress	Issue is resolved Agent moves the State to Resolved, then Closed Review ticket data Admin looks at consistent categories to spot common issues Tune the keywords Admin edits the flow conditions as wording changes Scale the solution New categories and subcategories are added over time
Interactions What interactions do they have at each step along the way?	Classroom, lab or staff room A failing network, projector, login or computer Classmates or colleagues may suggest raising a ticket ServiceNow login page in a web browser Incident Workflow form (custom, auto-numbered table)	Caller reference field (sys_user) Short Description text field Description text field Save / Submit button on the form No need to choose a Category or Subcategory	Flow Designer trigger: Record Created, Category is empty Flow Logic: If and Else If conditions using 'Contains' Update Record action on the Incident Workflow table Send Email action, To = the Caller's email	Caller's email inbox (Outlook, Gmail or similar) Incident Workflow list view and form view Assigned Group field (sys_user_group) Assigned to (sys_user) and State fields	State choices: Resolved and Closed Incident list, filters and reports by Category Flow Designer editor; changes tracked in the Update Set Category / Subcategory dependent-choice setup
Goals & motivations At each step, what is a person's primary goal or motivation? ('Help me...' or 'Help me avoid...')	Help me get my device or network working again Help me know where to report this problem Help me get to the right place quickly Help me report without filling a long form	Help me identify myself as the caller Help me describe the problem in my own words Help me add detail only if I want to Help me know my request was received	Help me handle every new ticket without manual review Help me pick the right category from the wording Help me keep the data consistent and error-free Help me tell the caller their ticket exists	Help me feel confident my ticket is logged Help me see a clean, standard ticket Help me send the ticket to the right team Help me start fixing the issue fast	Help me close the loop with the caller Help me spot recurring problems Help me keep the rules up to date Help me grow without rebuilding
Positive moments What steps does a typical person find enjoyable, productive, fun, motivating, delightful, or exciting?		Only the caller and a short description are needed No Category choices to think about, so submitting is quick	Fires automatically, so no agent has to read each new ticket Keyword rules are simple to read and understand Consistent categories remove human error No-code flow is easy to build and maintain	Instant confirmation email reassures the caller Standard, structured records every time Dependent choices keep Category and Subcategory matched Agents skip the manual triage step	Standardized data makes reporting easy Easy to extend with new keywords and branches
Negative moments What steps does a typical person find frustrating, confusing, angering, costly, or time-consuming?	Waiting for help while the problem blocks class or work	Vague wording like 'not working' gives the flow no keyword	Phrases must match closely: 'Wi-Fi' vs 'WiFi', 'Password' vs 'Forgot password' Tickets with no keyword match stay unclassified; no fallback branch Spelling in a rule must be exact (the draft uses 'Prajector') Only the first matching branch applies, so mixed issues get one category		Keywords are hard-coded and need manual updates
Areas of opportunity How might we make each step better? What ideas do we have? What have others suggested?	Offer a simple form asking only for Caller and Short Description	Show example wording to help the right keywords appear	Add synonyms from the requirements: Login, Hanging, WiFi, Slow Add a final Else branch that sends unmatched tickets to a triage queue Set the Assigned Group from the Category automatically	Include the ticket number and category in the confirmation email Route by Category to the right support group	Send a resolution email and a short satisfaction survey Dashboard of tickets by Category and Subcategory Keep keywords in a table so admins edit them without opening the flow Add new categories such as printers, email and software
