

Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Date	3 October 2026
Team ID	SWTID-2026-3698
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Ticket Creation	Select the Caller (user reference) Enter a Short Description of the issue Add an optional Description Auto-generated ticket Number with State = New
FR-2	Ticket Data Structure	Custom Incident Workflow table with Number, Caller, Category, Subcategory, Short Description, Description, State, Assigned Group, Assigned to Choice lists for Category, Subcategory and State Subcategory depends on Category (dependent choices)
FR-3	Automatic Classification	Flow triggers on Record Created when Category is empty Wi-Fi / Network sets Network / Wi-Fi Projector sets Hardware / Projector Forgot password sets Access / Forgot Password Slow computer sets Performance / Slow Computer
FR-4	Email Notification	Send an email to the caller after the ticket is created and classified Subject: 'Your Request for the issue has been submitted' with a ticket confirmation message
FR-5	Ticket Assignment and Handling	Set Assigned Group and Assigned to Update State: New, In progress, On hold, Resolved, Closed
FR-6	Maintenance and Change Management	Track all configuration in the Project Update Set Edit keywords and branches in Flow Designer without code

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	Callers only enter the Caller and a Short Description; Category and Subcategory are filled automatically. The form is simple and dependent choices show only valid options.
NFR-2	Security	Access is controlled through ServiceNow login and roles. Only authorised administrators can change the table, flow and keyword rules, and the confirmation email goes only to the ticket's caller.
NFR-3	Reliability	The flow runs on every new ticket with an empty Category. Fixed keyword rules give the same result for the same wording, so classification is consistent and free of human error.
NFR-4	Performance	Classification and the email notification happen automatically at ticket creation, with no manual triage wait. Simple 'Contains' conditions keep the flow light.
NFR-5	Availability	The solution runs on the ServiceNow platform, so tickets can be raised and classified at any time, not only when IT staff are available.
NFR-6	Scalability	New categories, subcategories and keywords can be added as new If / Else If branches and choices, so the solution can grow with the number of requests.
