

Project Design Phase
Problem – Solution Fit Template

Date	3 October 2026
Project ID	SWTID-2026-3698
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Problem – Solution Fit Template:

The Problem-Solution Fit simply means that you have found a problem with your customer and that the solution you have realized for it actually solves the customer's problem. It helps entrepreneurs, marketers and corporate innovators identify behavioral patterns and recognize what would work and why.

Purpose:

- Solve complex problems in a way that fits the state of your customers.
- Succeed faster and increase your solution adoption by tapping into existing mediums and channels of behavior.
- Sharpen your communication and marketing strategy with the right triggers and messaging.
- Increase touch-points with your company by finding the right problem-behavior fit and building trust by solving frequent annoyances, or urgent or costly problems.
- Understand the existing situation in order to improve it for your target group.

Template:

1. CUSTOMER SEGMENT(S) [CS] - Students and teachers of the school who raise IT support requests (Wi-Fi, projector, password, slow computer). - School IT helpdesk staff / agents who receive, classify and route the tickets.	6. CUSTOMER CONSTRAINTS [CC] - Small IT team and limited budget; no spare staff for manual triage. - No coding or machine-learning expertise available, so the solution must be no-code. - Callers write only a short description and cannot be expected to pick the right category. - Email notification depends on correct caller email and mail configuration.	5. AVAILABLE SOLUTIONS [AS] - Manual review of every ticket by IT staff. Pro: simple. Con: slow, error-prone, not scalable. - Callers choose Category/Subcategory themselves. Pro: no staff effort. Con: wrong or inconsistent selections. - Predictive / ML-based classification. Pro: handles varied text. Con: needs data, licensing and expertise; too heavy for a school. - Phone, walk-in or WhatsApp requests. Pro: easy. Con: no tracking or standard format.
2. JOBS-TO-BE-DONE / PROBLEMS [J&P] - Students/teachers: report an IT issue quickly and get it resolved without delay. - Callers: know that the request has been received. - IT staff: identify the issue type and assign the correct Category and Subcategory. - IT staff: route tickets efficiently and keep ticket data structured and standard.	9. PROBLEM ROOT CAUSE [RC] - Many requests arrive daily, and every ticket is classified by hand. - Manual classification depends on individual judgment, so it is inconsistent and causes delays in routing. - No automatic link between the words in the issue description and the Category/Subcategory fields. - No automatic acknowledgement, so callers are left unsure about their request.	7. BEHAVIOUR [BE] - Callers describe the issue briefly in the Short Description and submit a ticket (or ask in person). - IT staff open each ticket, read it, then select Category and Subcategory manually. - IT staff or callers follow up to confirm that the ticket was created. - Callers re-raise or chase tickets when there is no response.
3. TRIGGERS [TR] - Wi-Fi not working in the library or classroom. - Projector fails just before a lesson or presentation. - Forgotten password or login problem before an assignment or exam. - Computer becomes slow or hangs during class. - Growing ticket backlog on the IT desk. 4. EMOTIONS: BEFORE / AFTER [EM] - Before: frustrated, anxious, uncertain whether the request was received; IT staff overloaded. - After: relieved, confident and informed through an instant email; IT staff focus on solving issues.	10. OUR SOLUTION [SL] - A no-code ServiceNow Flow Designer flow, "Auto Classify School IT Tickets", on the custom table Incident WorkFlow (u_incident_workflow). - Trigger: Record Created when Category is empty. The caller enters only the Caller and Short Description. - Flow checks the Short Description for keywords and updates the record: Wi-Fi/Network → Network / Wi-Fi; Projector → Hardware / Projector; Forgot password → Access / Forgot Password; Slow computer → Performance / Slow Computer. - Subcategory is a dependent choice on Category, so data stays valid and consistent. - Send Email action acknowledges the ticket to the caller's email. - Packaged in an update set (Project Update Set) and exported as XML for deployment.	8.1. ONLINE [CH] - Caller submits the ticket on the Incident WorkFlow form in ServiceNow. - Flow auto-fills Category and Subcategory on the record. - Confirmation email "Your Request for the issue has been submitted" is sent to the caller. 8.2. OFFLINE [CH] - Callers report issues in person at the IT room or to a teacher, who then logs the ticket. - Notices or posters explaining how to raise a ticket and what to write in the short description. - IT staff update callers verbally while the issue is being fixed.
