

Project Design Phase Proposed Solution Template

Date	3 October 2026
Project ID	SWTID-2026-3698
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	- The school IT helpdesk receives many incident requests every day from students and teachers, such as Wi-Fi issues, projector failures, password problems and slow computers. - IT staff manually review each request, choose the Category and Subcategory and inform the caller. This is time-consuming, error-prone and not scalable as the number of requests grows.
2.	Idea / Solution description	- A no-code automation built with ServiceNow Flow Designer that classifies tickets at the time of creation. - The caller enters only the Caller and Short Description on a custom table, Incident WorkFlow. A flow triggers when a record is created with an empty Category and checks the Short Description for keywords. - Wi-Fi/Network → Network / Wi-Fi; Projector → Hardware / Projector; Forgot password → Access / Forgot Password; Slow computer → Performance / Slow Computer. - Subcategory is a dependent choice on Category, and a Send Email action confirms the ticket to the caller's email.
3.	Novelty / Uniqueness	- Classification and acknowledgement happen with no scripting and no machine learning, using only Flow Designer conditions and actions. - Dependent Category/Subcategory choices keep the data structured and consistent. - Designed for schools, with a simple keyword list that non-developers can read and edit. - The whole solution is packaged in an update set and can be exported as XML and moved to other instances.

S.No.	Parameter	Description
4.	Social Impact / Customer Satisfaction	• Students and teachers get an instant email confirming their request, so they know it has been received. • Faster routing means issues such as projector, Wi-Fi and password problems are handled sooner, with less lost class time. • IT staff spend less time on repetitive sorting and more time on solving problems. • Consistent classification removes human error and improves trust in the helpdesk.
5.	Business Model (Revenue Model)	• Built as an internal service for the school on its existing ServiceNow instance, so there is no separate product to buy. • The value is cost and time saving: lower manual triage effort and faster resolution. • The exported update set can be reused by other schools or colleges, for example as a ready-made package with setup support or as part of a managed IT support service.
6.	Scalability of the Solution	• New issue types are added by adding a Subcategory choice and one more Else If condition with an Update Record action. • Works for small to medium environments such as educational institutions, and the update set can be moved to other ServiceNow instances. • Can be extended later with assignment automation, SLA tracking and predictive intelligence.
